Today

Announcements

- homework 5 Friday at 11:59p
 - but can be turned over the break if need be

Midterm in class on Thursday after break

- closed book, closed notes, covers through whatever we get through today
- mix of short answer and long answer
- practice exam posted

TCP

- overview
- reliable data transfer
- seq #s and ack #s
- timeouts
- reliable data transport
- connection management

Midterm overview

In class on Thursday, March 30

- closed book, closed notes
- covers material in lectures 1 to 13

Will not ask questions on

- probability
- p2p or distributed hash tables

5 questions

- app layer short questions
- HTTP connections
- transport layer short questions
- reliable data transport
- Something fun?

2 questions

App layer and transport layer short questions

- around 6 in total
- similar to review questions in book
- should only need to write a few sentences to answer

1 question

HTTP persistent vs. non-persistent connections

- review related homework question

1 question

Design a reliable data transfer protocol

- given channel characteristics design most efficient protocol
- be able to design reliable data transfer protocol like stop-and-wait
- know your timeline diagrams

1 question

Something fun to think about ???

TCP

OVERVIEW

Transmission Control Protocol (TCP)

RFCs:
793, 1122, 1323,
2018, 2581

Main transport protocol used in Internet, provides

- **mux/dmux**: which packets go where
- **connection-oriented, point-to-point**
 - 2 hosts set up connection before exchanging data, tear down after
 - bidirectional data flow (full duplex)
- **flow control**: don't overwhelm receiver
- **congestion control**: don't overwhelm network
- **reliable**: resends lost packets, checks for and corrects errors
- **in-order**: buffers data until sequential chunk to pass up
- **byte stream**: no msg boundaries, data treated as stream

How does TCP provide these services?

Using many techniques we already talked about

Sliding window

- congestion and flow control determine window size
- seq #s are byte offsets

Cumulative ACKs but does not drop out-of-order packets

- **only one retransmission timer**
 - intuitively, associate with oldest unACKed packet
- **timeout period**
 - estimated from observations
- **fast retransmit**
 - 3 duplicate ACKs trigger early retransmit

TCP is not perfect but works pretty well!

TCP segment structure

No.	Time	Source	Destination
42	4.878920	172.217.11.10	vmanfredismbp2.wireless.wesleyan.edu
44	4.879137	outlook-namnortheast2.offi...	vmanfredismbp2.wireless.wesleyan.edu

```

TCP

SEQ #S AND ACK #S

TCP seq. numbers, ACKs

Sequence #s

- byte stream # of first byte in segment's data

Acknowledgements

- seq # of next byte expected from other side
- cumulative ACK

Q: how does receiver handle out-of-order segments?

- TCP spec doesn't say
- up to implementer

Outgoing segment from sender

source port #	dest port #
sequence number	
acknowledgement number	
	rwnd
checksum	urg pointer

Incoming segment to sender

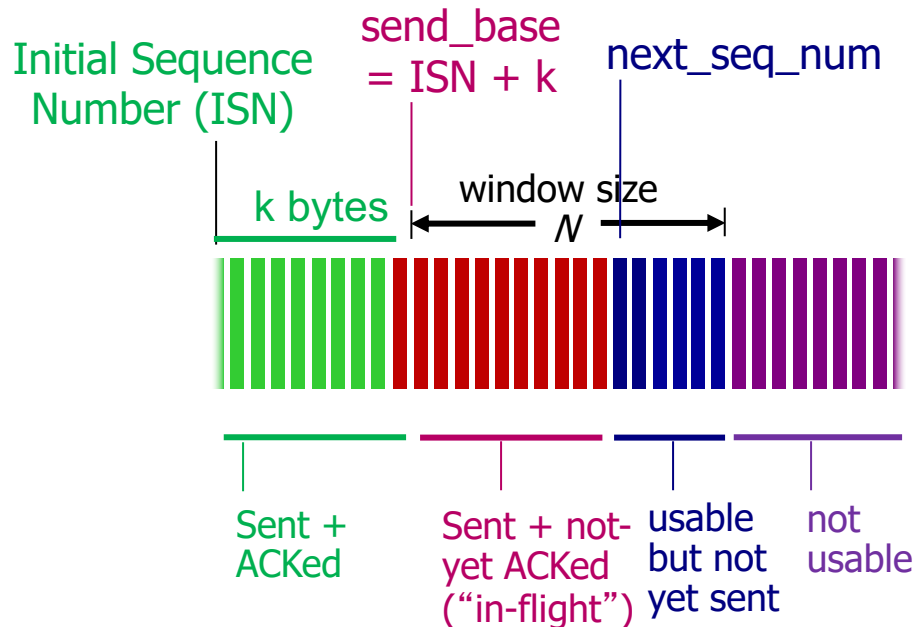

source port #	dest port #
sequence number	
acknowledgement number	
A	rwnd
checksum	urg pointer

TCP ACKs

Cumulative ACKs (but different than in Go-Back-N)

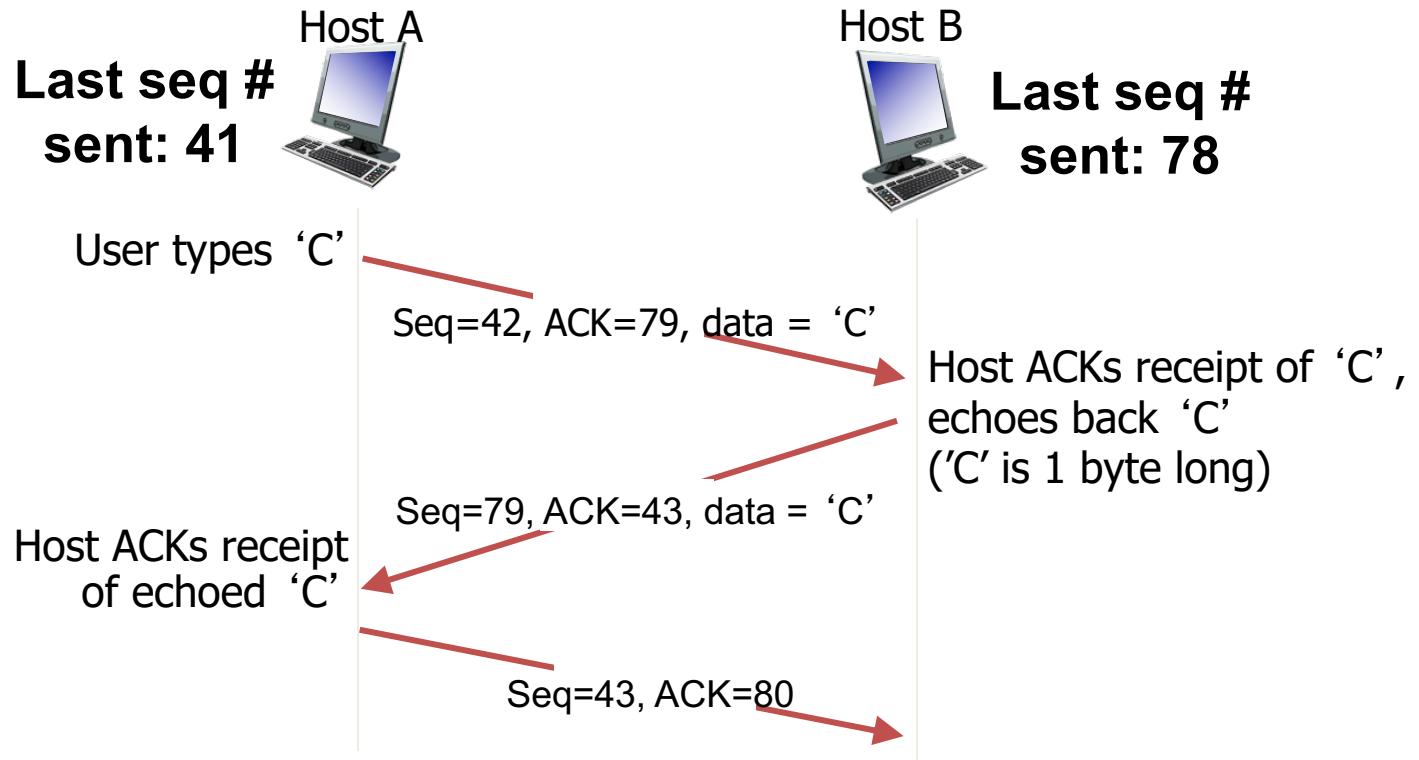

- ACKs what receiver expects next, not last packet received
 - implicitly also ACKs everything up to sequence number received
- only 1 retransmission timer (for first pkt in window)
 - sender retransmits only first pkt in window if no ack when timer expires

Sequence #s are not sequential: counting bytes not packets

TCP seq. numbers, ACKs

Sequence numbers are synchronized during connection set-up

Simple nc scenario

Host 1

Transmission Control Protocol,

Source Port: 54573

Destination Port: 443

[Stream index: 2]

exchange

Transmission Control Protocol, Src Po

Source Port: 443

Destination Port: 54573

[Stream index: 2]

[TCP Segment Len: 0]

Sequence number: 3712814909

Acknowledgment number: 59452278

Header Length: 32 bytes

► Flags: 0x010 (ACK)

Window size value: 122

[Calculated window size: 15616]

[Window size scaling factor: 128]

What are seq and ack #s in next
segment from receiver?

Segment size

Max length of IP packet in bytes

- MTU: Maximum Transmission Unit
- 1500 bytes if Ethernet used as link layer protocol

Max length of TCP data in bytes

- MSS: Maximum Segment Size
- $MSS = MTU - IP\ hdr - TCP\ hdr$
 - TCP header ≥ 20 bytes

TCP segment sent when either it is full (meets MSS) or not full but timeout occurs

TCP TIMEOUTS

TCP timeout

Q: how to set TCP timeout value?

Longer than RTT (ideally proportional)

- but RTT varies

Too short

- premature timeout
- unnecessary retransmissions

Too long

- slow reaction to segment loss

How to estimate RTT

SampleRTT

- time from segment transmission to ACK reception
- ignore retransmissions
 - since problems associating retransmitted ACK with right pkt
 - will vary: use average of several measurements

EstimatedRTT

- exponential weighted moving average of **sampleRTTs**
- influence of past sample decreases exponentially fast
- typical value: $\alpha = 0.125$

$$\text{EstimatedRTT} = (1-\alpha) * \text{EstimatedRTT} + \alpha * \text{SampleRTT}$$

Variation in RTT

Q: How to handle variation in RTT?

- timeout interval should be \geq EstimatedRTT
 - because of variation of RTT values
 - large variation in EstimatedRTT \Rightarrow larger safety margin

Handling variation in RTT

Estimate SampleRTT deviation from EstimatedRTT

$$\text{DevRTT} = (1-\beta) * \text{DevRTT} + \beta * |\text{SampleRTT} - \text{EstimatedRTT}|$$

(typically, $\beta = 0.25$)

$$\text{TimeoutInterval} = \text{EstimatedRTT} + 4 * \text{DevRTT}$$

↑
“safety margin”

If timeout occurs: timeout interval doubled to prevent premature timeout for subsequent segments

TCP

RELIABLE DATA TRANSFER

TCP reliable data transfer

TCP creates rdt service on top of IP's unreliable service

- pipelined segments
- cumulative acks
- single retransmission timer

Retransmissions triggered by

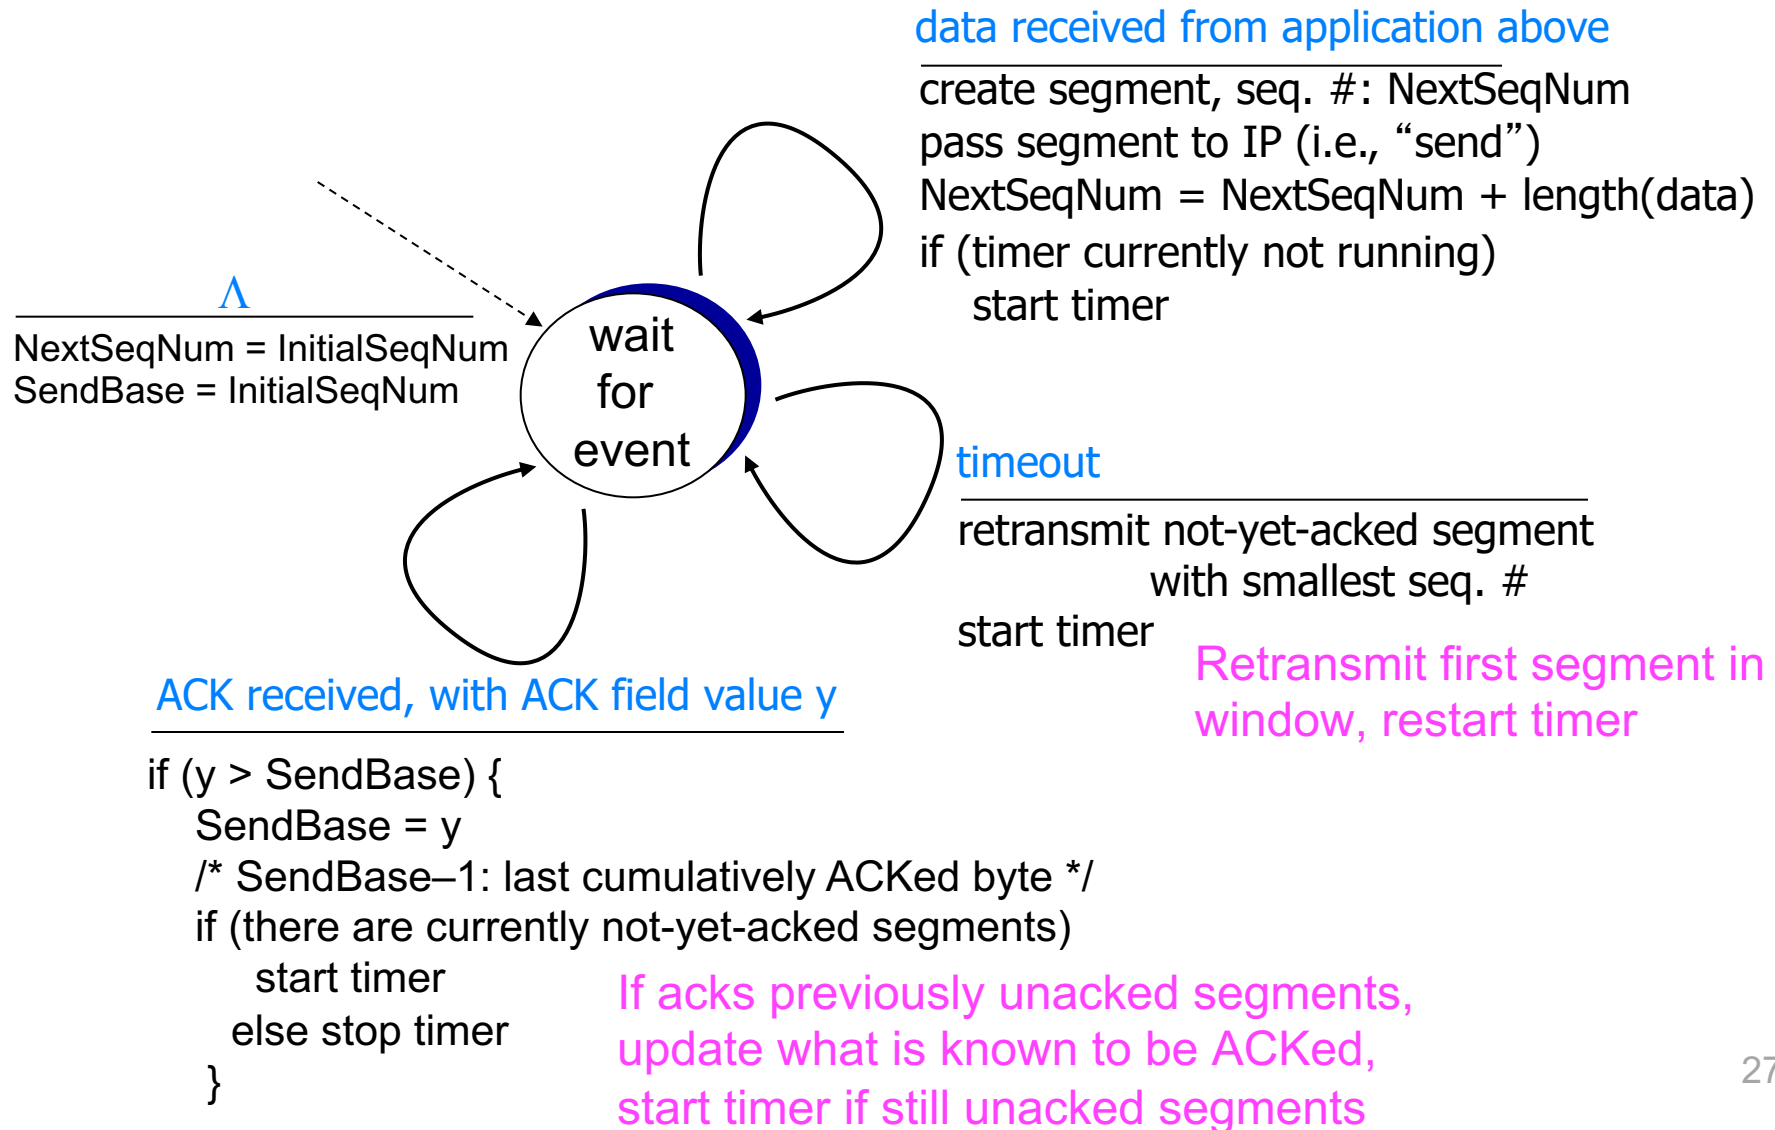

- timeout events
- duplicate ACKs

Let's initially consider simplified TCP sender

- ignore duplicate acks
- ignore flow control, congestion control

TCP sender (simplified)

Seq # is byte-stream # of first data byte in segment. Timer is for oldest unacked segment

TCP: retransmission scenarios

TCP: retransmission scenarios

Duplicate ACKs

Time-out period often relatively long

- long delay before resending lost packet

Duplicate ACKs indicate isolated loss

- rather than congestion causing many losses
 - sender often sends many segments back-to-back
 - if segment is lost, likely many duplicate ACKs
 - ACKs being received indicates some packets received at destination since ACK sent for every packet: so not congestion

TCP fast retransmit

- if sender receives 3 ACKs for same data (triple duplicate ACKs)
 - resend unacked segment with smallest seq #
- Q: why 3?
 - pkts may just have been reordered otherwise
 - likely that unacked segment lost, so don't wait for timeout

TCP fast retransmit

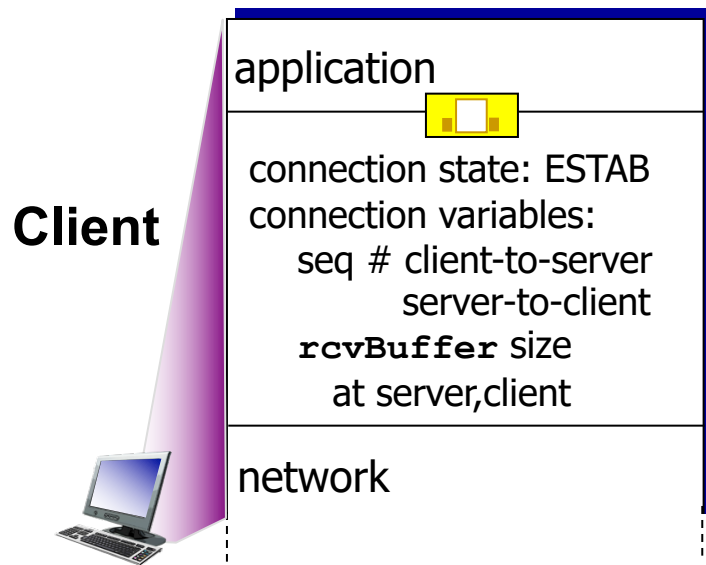

TCP

CONNECTION MANAGEMENT

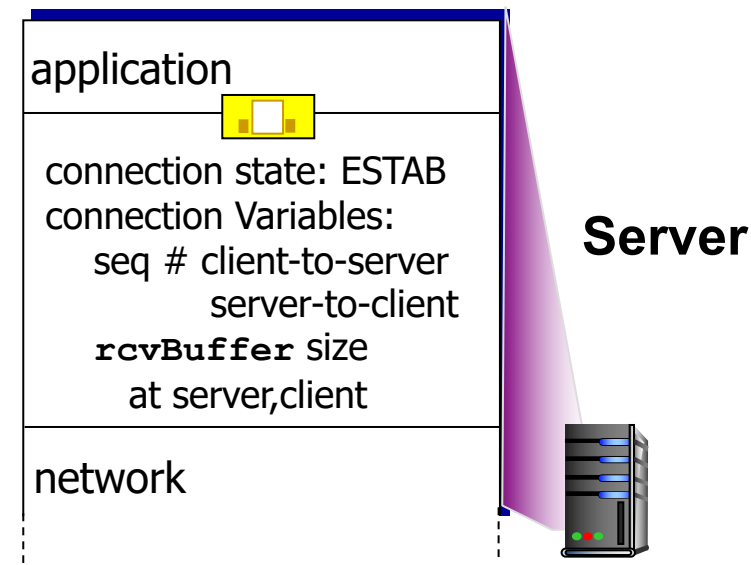

Connection Management

Before exchanging data, sender/receiver handshake

- establish connection and connection parameters
- tear down connection when done

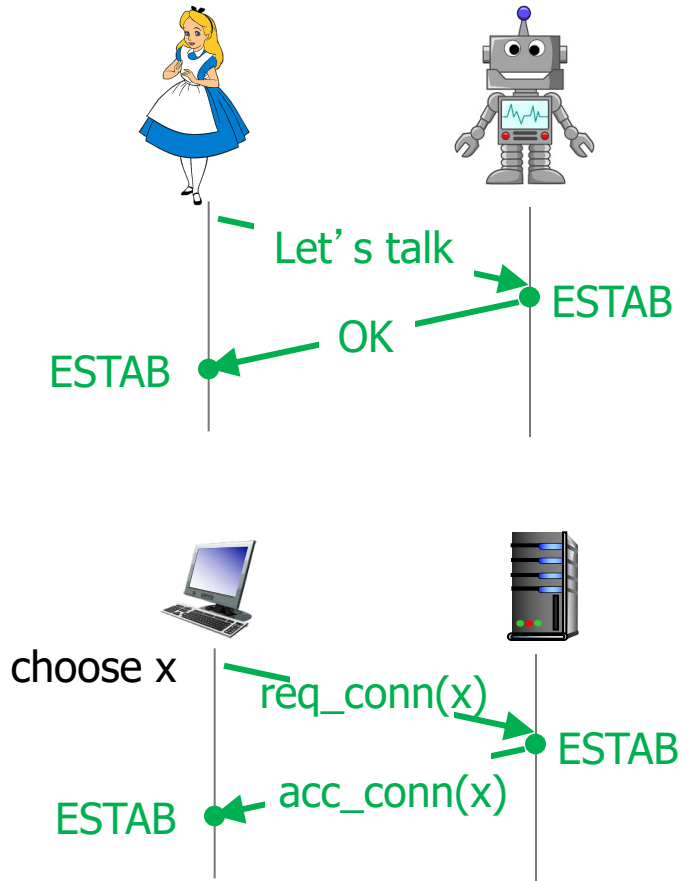

```
sock = sock.connect((host, port))
```

```
conn, addr = server_sock.accept()
```

Agreeing to establish a connection

2-way handshake:

Q: will 2-way handshake always work in network?

- variable delays
- retransmitted messages
 - e.g. `req_conn(x)` due to message loss
- message reordering
- can't see other side

2-way handshake failure scenarios

TCP 3-way handshake

client state

LISTEN

SYNSENT

ESTAB

choose init seq num, x
send TCP SYN msg

received SYNACK(x)
indicates server is live;
send ACK for SYNACK;
this segment may contain
client-to-server data

server state

LISTEN

SYN RCVD

ESTAB

choose init seq num, y
send TCP SYNACK
msg, acking SYN

received ACK(y)
indicates client is live

SYNbit=1, Seq=x

SYNbit=1, Seq=y
ACKbit=1; ACKnum=x+1

ACKbit=1, ACKnum=y+1

TCP 3-way handshake: FSM

Look at the state of tcp connections

```
> netstat -ta
```

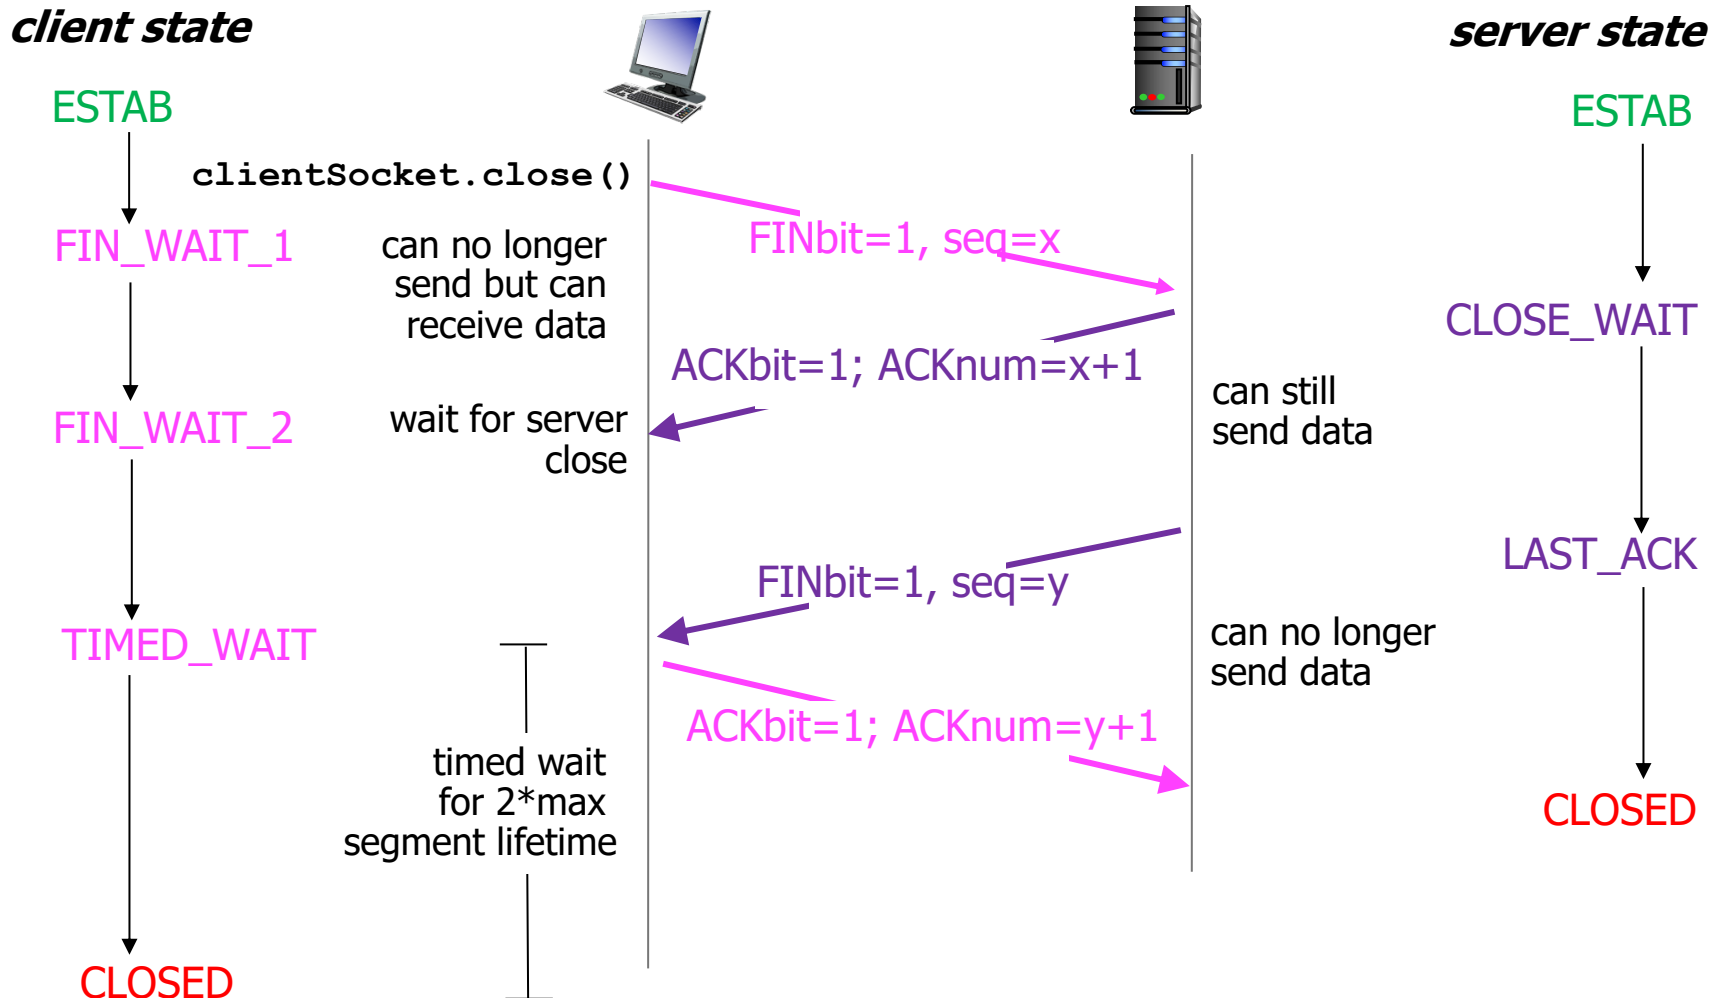

```
Active Internet connections (including servers)
```

Proto	Recv-Q	Send-Q	Local Address	Foreign Address	(state)
