Today

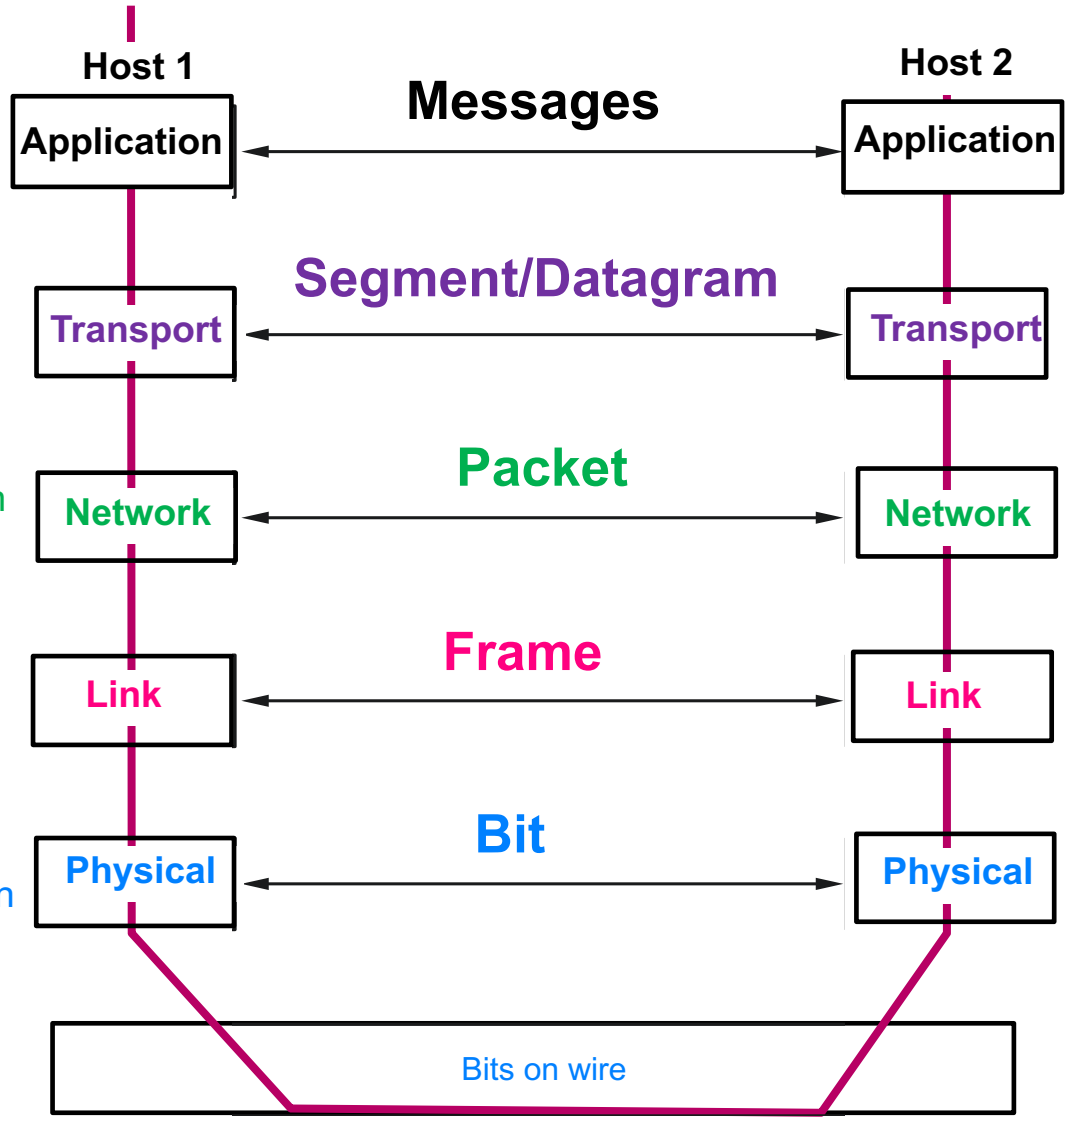
1. Link layer
   - overview
   - MAC addresses
   - Address Resolution Protocol (ARP)
   - switches

Link Layer

OVERVIEW

Internet protocol stack

Protocols	Service provided
• HTTP, DNS, DHCP, TLS, …	• Support network applications
• TCP, UDP, QUIC, …	• Deliver msgs to app endpoints, flow control, reliability
• IP, routing protocols (BGP, OSPF, RIP, …)	• Route segments from source to destination host (indirect)
• Ethernet, 802.11, …	• Move pkt over link from one host to next host (direct)
• Ethernet phy, 802.11 phy, …	• Move individual bits in frame from one host to next



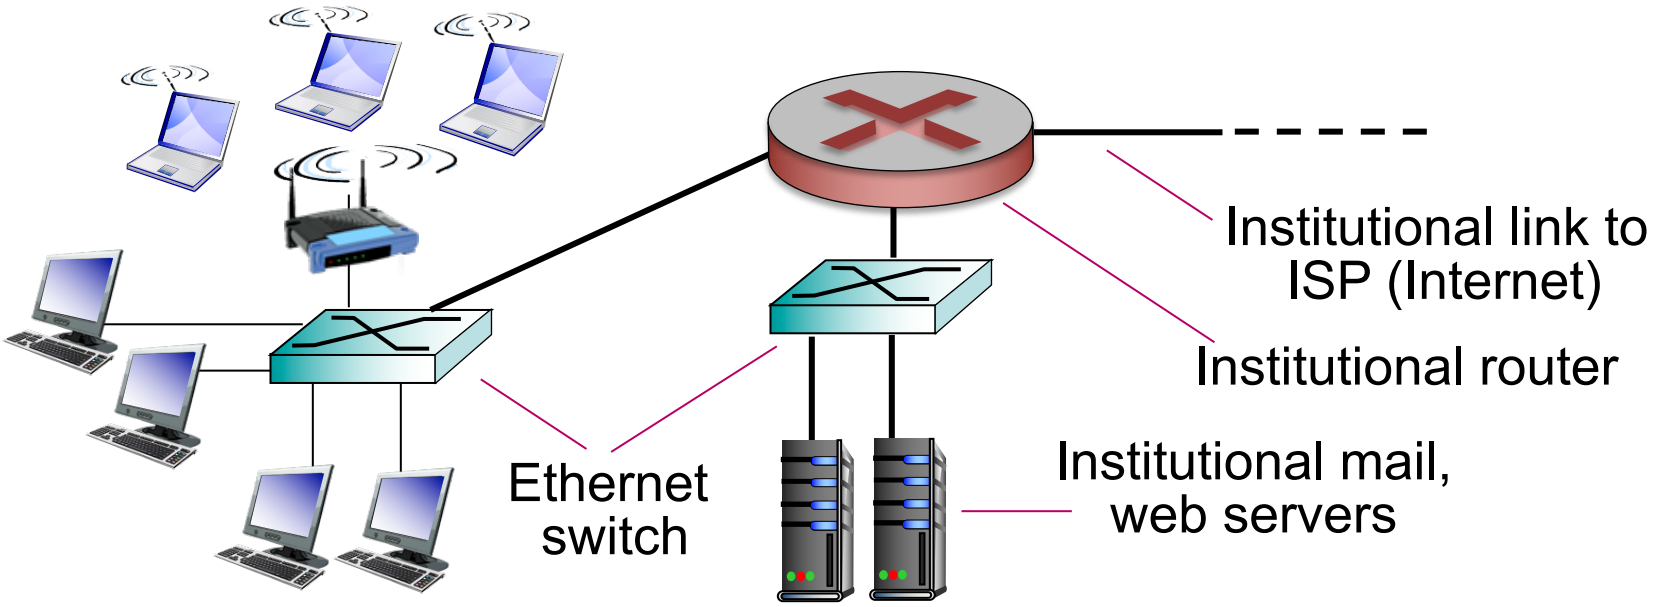
Link layer

Goal

- divide packet up into frames, transfer frame across link

Different link media have different characteristics

- will use different protocols with different services to transfer frame
- e.g., in local area network (LAN), frames broadcast to every device



Link layer services

Framing

- encapsulate packet into frame
- add header, trailer to detect start/end of frame

Link access

- if shared media like wireless link, how to share?
  - time/freq division, random access, …
- MAC addresses in frame headers identify src, dst
  - different from IP address, only used within network

Reliable delivery between 2 end hosts of link

- low-bit error links rarely use: fiber, some twisted pair
- high bit error: wireless link

Q: why both link-level and end-end reliability?

What if error on last hop to dst?

Other link layer services

Flow control

- pacing between adjacent sending and receiving nodes

Error detection

- errors caused by signal attenuation, noise, interference, …
- receiver detects presence of errors, e.g., via checksum
  - signals sender for retransmission or drops frame

Error correction

- receiver identifies and corrects bit error(s)
- don't necessarily need to retransmit: instead use coding

Half-duplex vs. full-duplex

- half duplex, e.g., wireless link
  - nodes at both ends of link can transmit, but not at same time

Where is the link layer implemented?

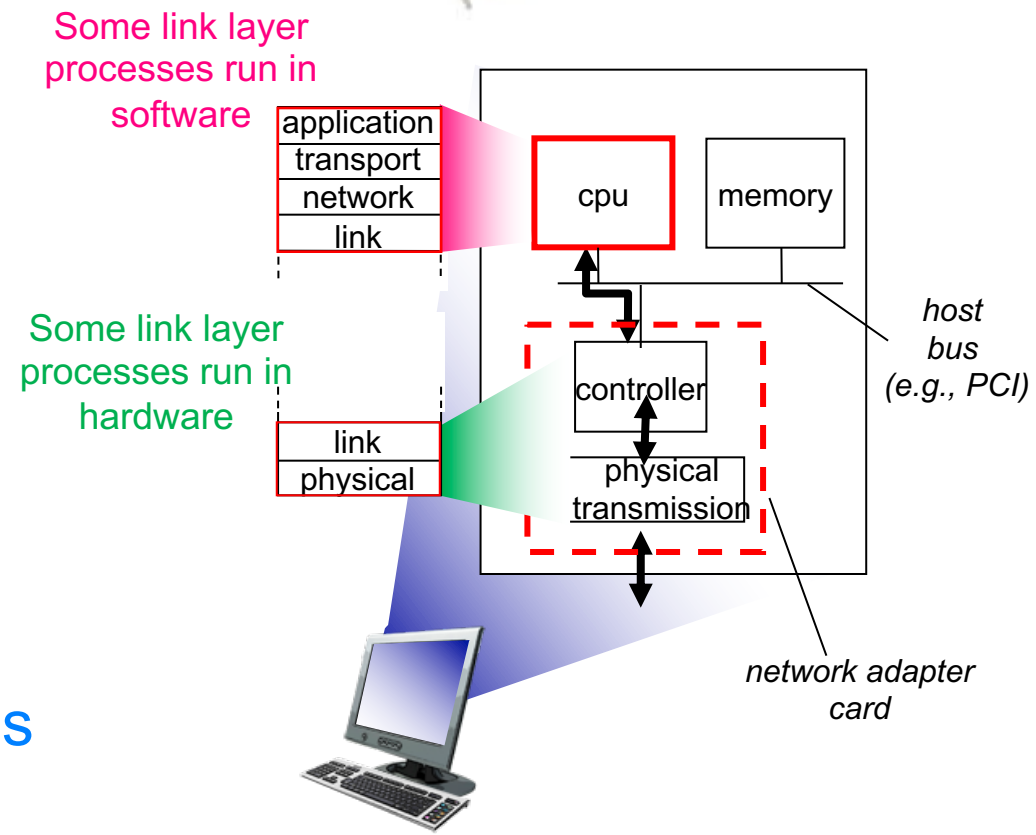
In network interface card (NIC) or on chip

- Ethernet card
- 802.11 card
- Ethernet chipset

Implements

- link layer
- physical layer: e.g., transmit radio wave

Attaches into system buses on host's system



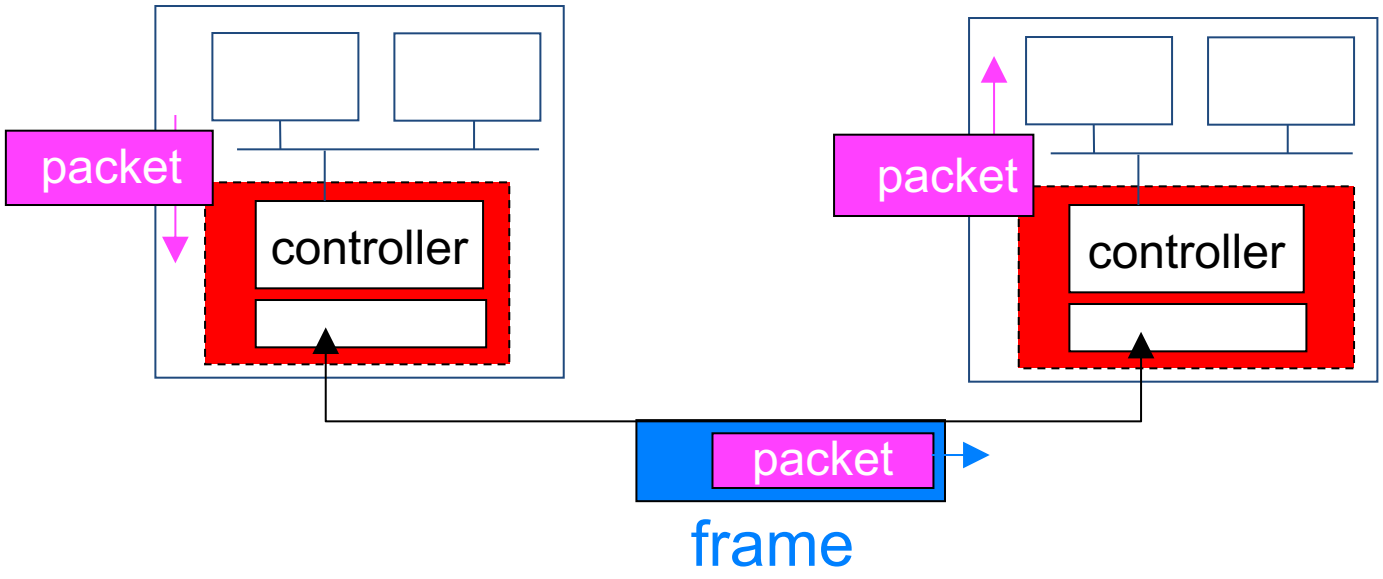
Communication between network interfaces

Sender

- encapsulates pkt in frame
- adds error checking bits, rdt, flow control, …

Receiver

- looks for errors, rdt, flow control, …
- extracts pkt, passes to upper layer at receiving side



Link Layer

MAC ADDRESSES

MAC addresses

32-bit IP address

- software address: network-layer address for interface
- used for layer 3 (network layer) forwarding

48-bit MAC address

- link-layer address for interface
  - aka hardware, Ethernet, LAN, or physical address
  - e.g., 1A-2F-BB-76-09-AD
  - burned in NIC read only memory, also sometimes software settable
- used for layer 2 (link layer) forwarding
  - get frame from one interface to another physically-connected interface

Why both MAC and IP addresses?

IP address: like postal address

- hierarchical address: not portable
- changes with location
  - address depends on IP subnet to which node is attached

MAC address: like SSN #

- flat address: portable
- does not change with location
  - can move LAN card from one LAN to another

LANs designed for arbitrary network layer protocol, not just IP

- don't want to pass frame up to network layer for every frame
  - faster, even if on same LAN to not go up to network layer

Your MAC address

```
> ifconfig
lo0: flags=8049<UP,LOOPBACK,RUNNING,MULTICAST> mtu 16384
        options=1203<RXCSUM,TXCSUM,TXSTATUS,SW_TIMESTAMP>
        inet 127.0.0.1 netmask 0xff000000
        inet6 ::1 prefixlen 128
        inet6 fe80::1%lo0 prefixlen 64 scopeid 0x1
        nd6 options=201<PERFORMNUD,DAD>
gif0: flags=8010<POINTOPOINT,MULTICAST> mtu 1280
stf0: flags=0<> mtu 1280
en0: flags=8863<UP,BROADCAST,SMART,RUNNING,SIMPLEX,MULTICAST> mtu 1500
        ether 78:4f:43:73:43:26
        inet6 fe80::1c8a:4bcb:b52d:9d1d%en0 prefixlen 64 secured scopeid 0x5
        inet 129.133.187.174 netmask 0xfffff000 broadcast 129.133.191.255
```

```

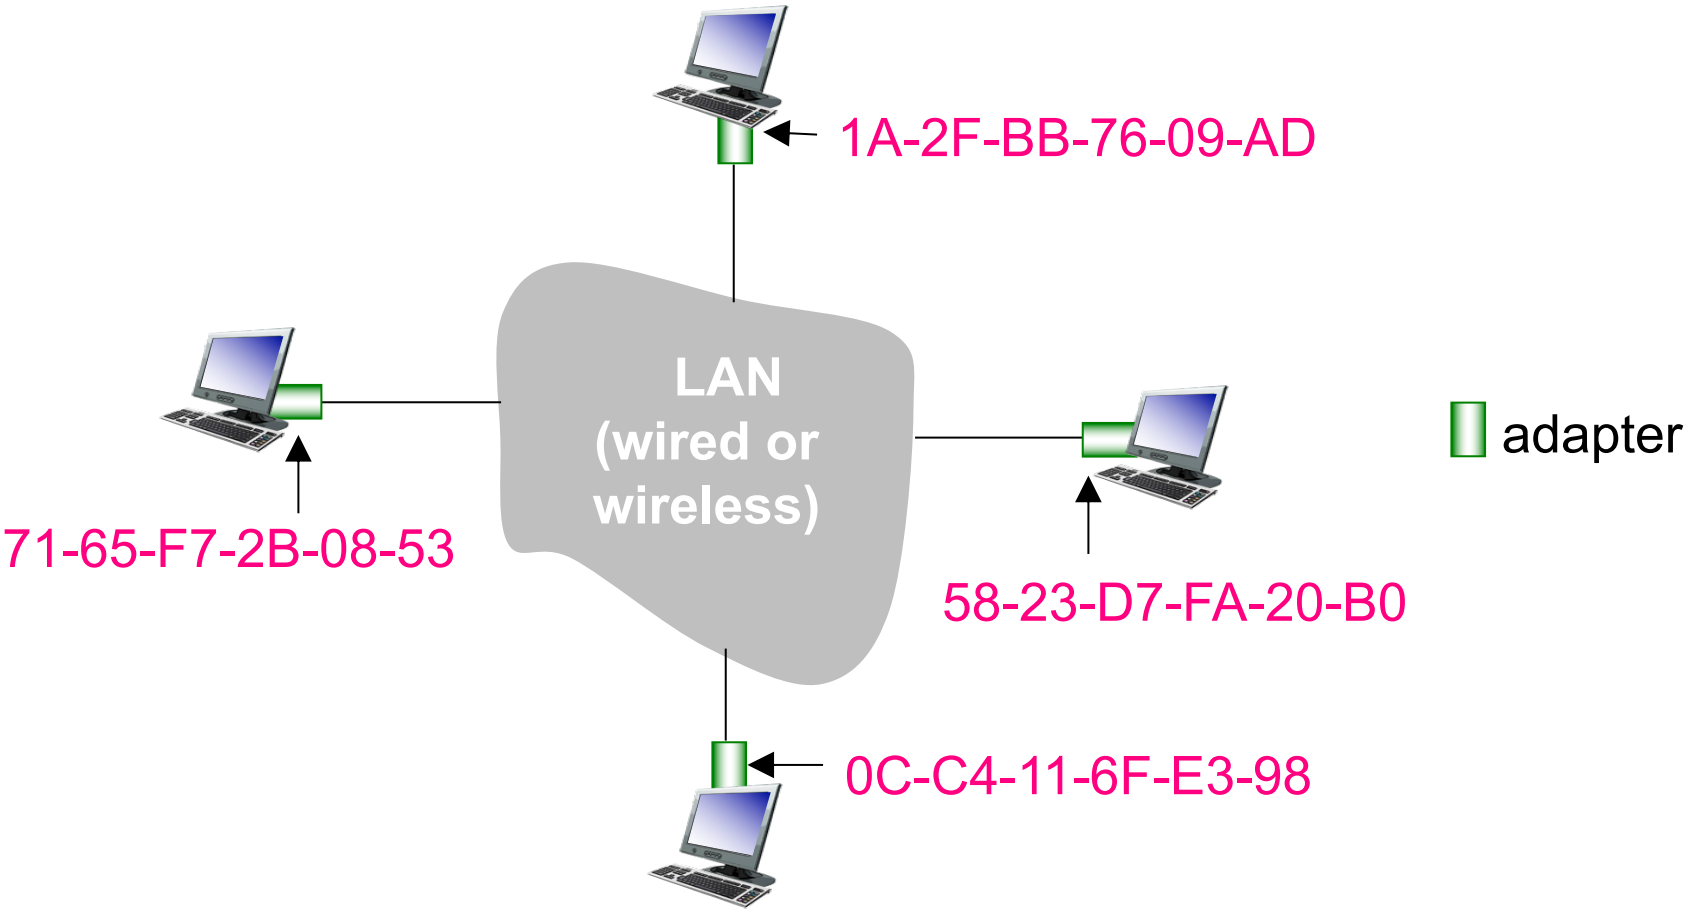
LAN addresses and ARP

Each adapter on LAN has unique LAN address



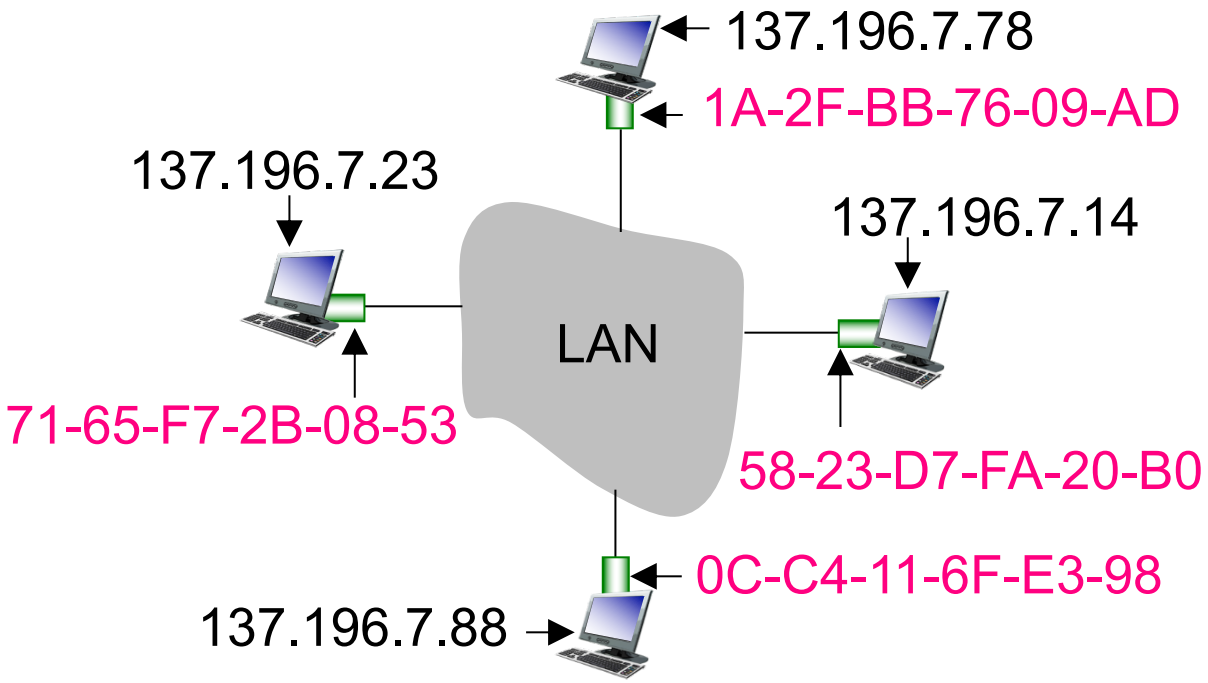
Link Layer

ADDRESS RESOLUTION PROTOCOL

Address Resolution Protocol (ARP)

ARP

- link layer protocol that translates between MAC and IP addr
- ARP table in every IP device on LAN
  - <IP addr; MAC addr; TTL>
  - TTL: time after which addr mapping forgotten (typically 20 min)



ARP in wireshark

No.	Time	Source	Destination	Length	Info
5406	48.129810	Apple_73:43:26	6e:57:ca:90:05:64	42	Who has 172.20.10.1? Tell 172.20.10.11
5410	48.153207	Apple_73:43:26	6e:57:ca:90:05:64	42	Who has 172.20.10.1? Tell 172.20.10.11
5413	48.193996	Apple_73:43:26	6e:57:ca:90:05:64	42	Who has 172.20.10.1? Tell 172.20.10.11

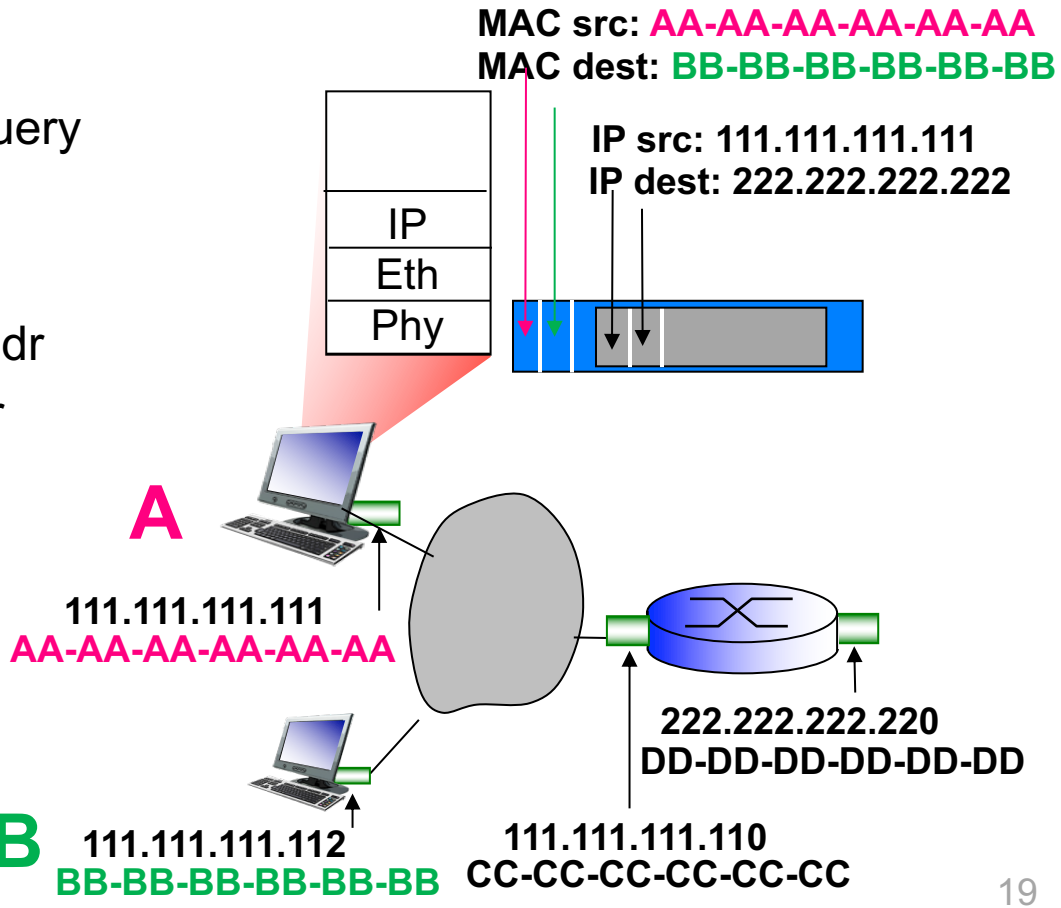
```
▶ Frame 5406: 42 bytes on wire (336 bits), 42 bytes captured (336 bits) on interface 0
▼ Ethernet II, Src: vmanfredis-MacBook-Pro-2.local (78:4f:43:73:43:26), Dst: 6e:57:ca:90:05:64 (6e:57:ca:90:05:64)
  ▶ Destination: 6e:57:ca:90:05:64 (6e:57:ca:90:05:64)
  ▶ Source: vmanfredis-MacBook-Pro-2.local (78:4f:43:73:43:26)
    Type: ARP (0x0806)
▼ Address Resolution Protocol (request)
    Hardware type: Ethernet (1)
    Protocol type: IPv4 (0x0800)
    Hardware size: 6
    Protocol size: 4
    Opcode: request (1)
    Sender MAC address: vmanfredis-MacBook-Pro-2.local (78:4f:43:73:43:26)
    Sender IP address: vmanfredis-MacBook-Pro-2.local (172.20.10.11)
    Target MAC address: 00:00:00_00:00:00 (00:00:00:00:00:00)
    Target IP address: 172.20.10.1 (172.20.10.1)
```

Forwarding within same LAN

A wants to send pkt to B but B's MAC addr not in A's ARP table

1. A broadcasts ARP query containing B's IP addr
   - destination MAC addr
     - FF-FF-FF-FF-FF-FF
   - all nodes on LAN receive query
2. B receives ARP query
   - replies to A with its MAC addr
   - frame sent to A's MAC addr
3. A caches IP,MAC addr pair
   - until TTL expires



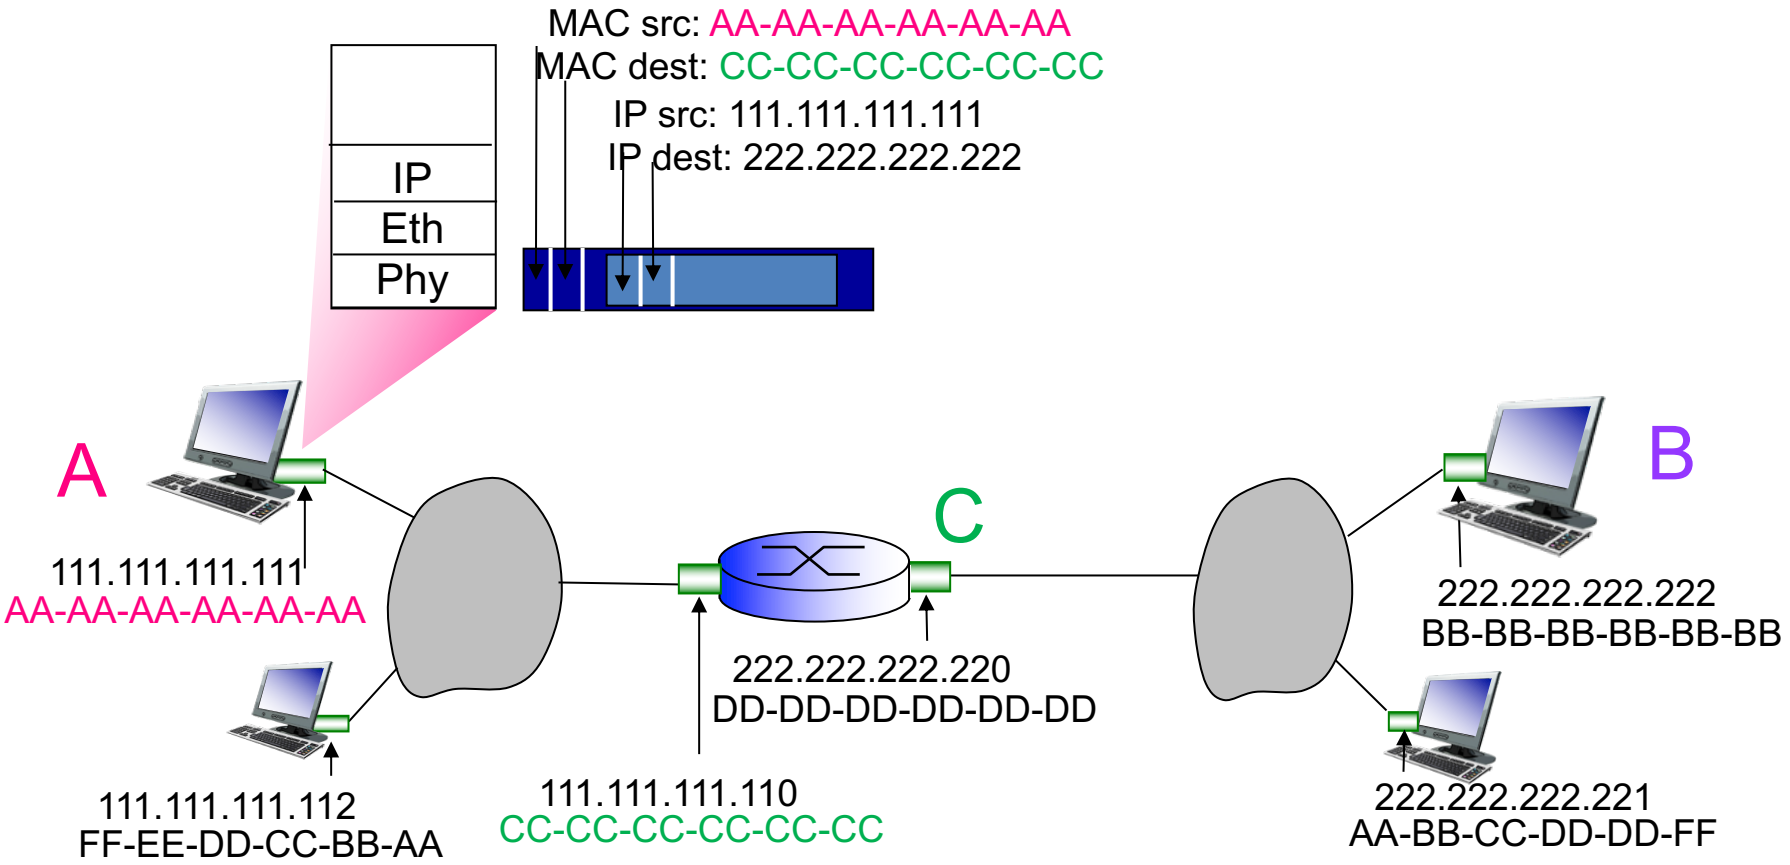
Routing to another LAN

Work through example on board

Routing to another LAN

Send pkt from A to B via gateway router C

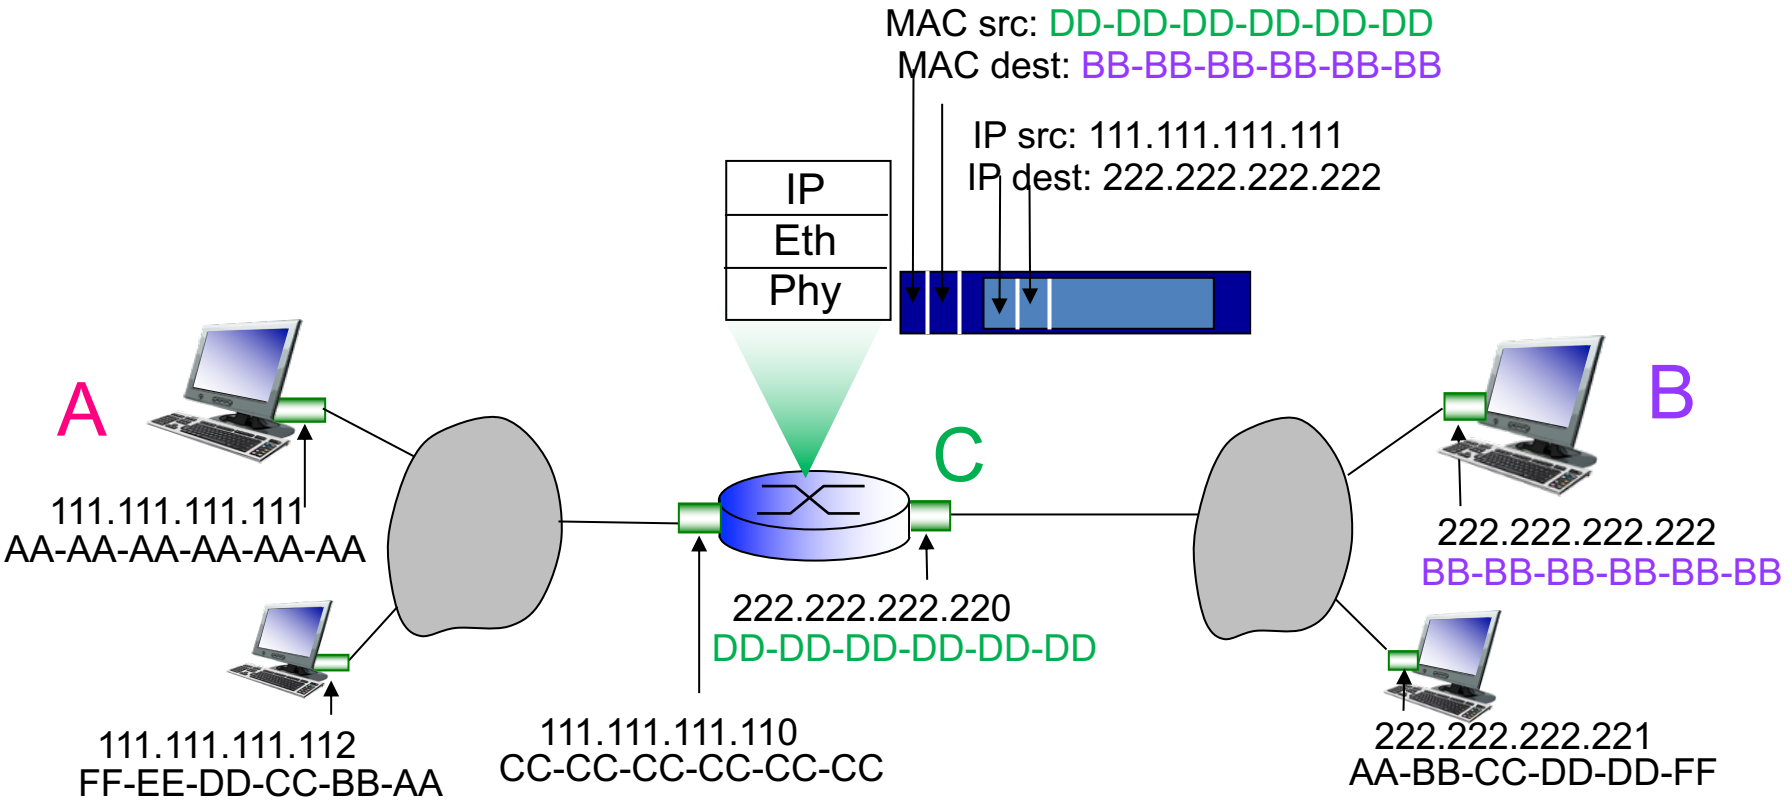
– assume A knows B's IP addr, C's IP addr, C's MAC addr



Routing to another LAN

Send pkt from A to B via gateway router C

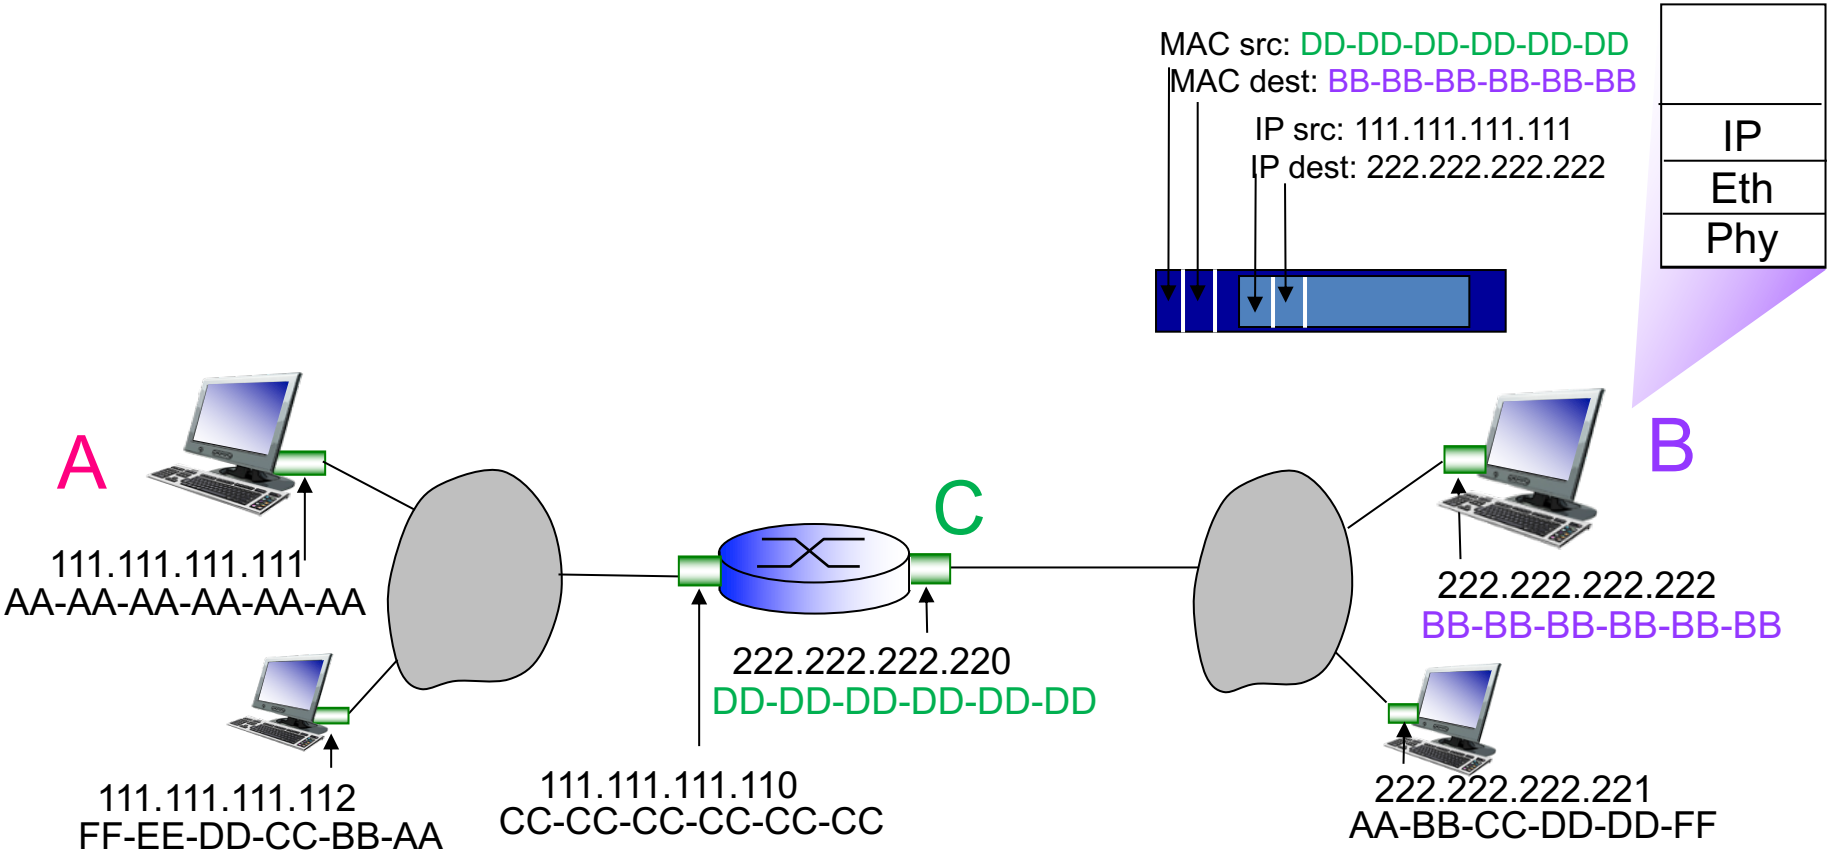
– assume A knows B's IP addr, C's IP addr, C's MAC addr



Routing to another LAN

Send pkt from A to B via gateway router C

– assume A knows B's IP addr, C's IP addr, C's MAC addr



Link Layer

SWITCHES

Ethernet switch

Ethernet

- dominant wired link layer protocol

Switch

- link-layer device to store and forward Ethernet frames
  - examine incoming frame's MAC address
  - selectively forward frame to one-or-more outgoing links
- transparent
  - hosts are unaware of presence of switches
- self-learning
  - switches do not need to be configured

Aside

- you'll see Ethernet listed as link layer protocol when you use wifi
  - quirk of wireshark, which we won't get into

Switches vs. routers

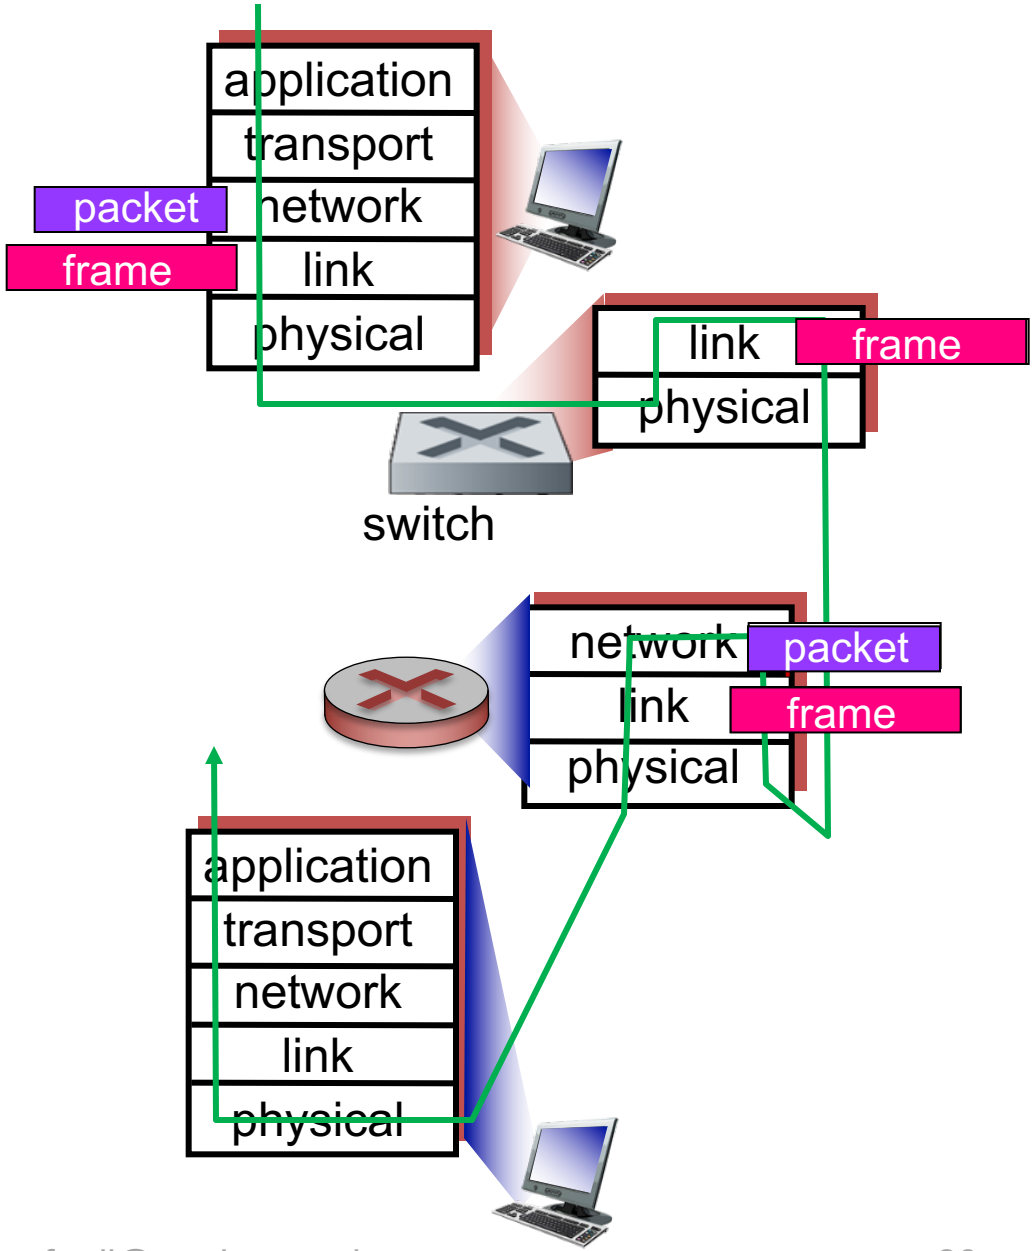
Both are store-and-forward

Routers

- data plane only examines network-layer headers
- control plane (BGP) may look at app layer

Switches

- examine link-layer headers



Switches vs. routers

Both have forwarding tables

Routers

- compute tables using routing algorithms, IP addr

Switches

- learn forwarding table using flooding, MAC addr

Q: Key differences between switches and routers?
